

Stoichiometry

Calculate quantities of substances in chemical reactions

For a Balanced chemical equation, the coefficients show:

formula units that react mole ratio of reactants & products (with molar mass) # grams of reactants & products

Uses mole concept to calculate chemical quantities

Kirk Used Stoichiometry to Defeat the Gorn

Stoichiometry Lab

Today's Lab (Work as a Table Unit in the Hood)

Purpose: To investigate reaction of sodium carbonate and hydrochloric acid

Na₂CO₃ + 2 HCl → 2 NaCl + CO2 + H₂O

Procedure:

Measure the mass of an evaporating dish and a watch glass.

Remove the watch glass, tare the balance, and add $1.5-2~\mathrm{g}$ of $\mathrm{Na_2CO_3}$

Record the exact mass of Na_2CO_3 in the dish

Remove the evaporating dish and Na_2CO_3 from the balance Slowly add HCl to the Na_2CO_3 until no more gas is evolved

Safety note: HCl is caustic to the skin and eyes! Use caution.

Stoichiometry says you will not need more than 7 mL for 2 g of $\mathrm{Na_2CO_3}$

xs HCl will be evaporated into the air you might breathe

Stoichiometry Lab

When the reaction is complete, use Bunsen Burner to evaporate to dryness Use the watch glass as a cover to help prevent spattering. Heat the contents very carefully

Allow the evaporating dish and watch glass to cool completely Weigh the evaporating dish, NaCl and watch glass.

The NaCl product is drain disposable

Wash out the product with water

Clean the evaporating dish and watch glass with soap and water

Rinse evaporating dish with tap water & RO water Dry the watch glass & evaporating dish and return to their drawers. Clean up all other glassware

Return all pieces of equipment to proper storage drawer or cabinet

Some "Numbers"

How many grams ${\rm CO_2}$ are formed from 2.00 grams ${\rm Na_2CO_3?}$

 $\mathrm{Na_{2}CO_{3\;(aq)}+\;2\;HCl}_{\;(aq)} \rightarrow 2\;\mathrm{NaCl}_{\;(aq)} + \mathrm{H_{2}CO_{3\;(aq)}}$

→ H₂O_(l) + CO_{2 (g)}

 $2.00 \;\; g \; Na_2CO_3 \;\; x \; \underline{1 \; mole \;\; Na_2CO_3} \;\; x \;\; \underline{1 \; mole \;\;\; CO_2} \;\; x \;\; \underline{44.01 \;\;\; g} = 0.83 \; g \\ 1 \;\; \underline{1 \;\; mole \;\; Na_2CO_3} \;\; \overline{1 \;\; mole \;\; CO_2}$

How much ${\rm CO_2}$ (mL) is formed from 2.00 grams ${\rm Na_2CO_3}$? (One mole of a substance occupies 22.4 L at STP)

0.83 g CO₂ x $\frac{1 \text{ mole CO}_2}{44.01 \text{ g}}$ x $\frac{22.4 \text{ L}}{1 \text{ mole}}$ = 0.422 L \Rightarrow 422 mL

LPT

More "Numbers"

How much 6 M HCL is needed to completely react with 2.00 g $\rm Na_2CO_3$? (6 M HCL means 6 moles HCl per liter of solution)

 $\frac{2.00~g~x~\underline{1~mole~Na}_{2}CO_{3}~x~\underline{2~mole~HCl}~x~\underline{1~L~x~}\frac{1000~mL}{6~moles~HCl}=6.28~mL}{1~05.99~g~}$

How many grams NaCl are formed from 2.00 grams $\mathrm{Na_2CO_3}$?

 $\frac{2.00 \text{ g x}}{105.99} \frac{1 \text{ mole Na}_2 \text{CO}_3}{\text{g}} \text{ x} \frac{2 \text{ mole NaCl}}{1 \text{ mole Na}_2 \text{CO}_3} \text{ x} \frac{58.43}{1 \text{ mole NaCl}} = 2.21 \text{ g}$

 $\begin{tabular}{lll} \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{Theoretical} & (Calculated Yield based on Stoichiometry) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment) & x \ 100 \\ \hline \mbox{$\%$ Yield = $\underbrace{Actual} & (Obtained in Experiment$

 $\% \ Error = \ \ \frac{Actual \ Yield \ (g) \ \ \, \cdot \ \, Theoretical \ Yield \ (g)}{Theoretical \ Yield \ (g)} \quad x \quad 100$

% Error should be small and negative

For isolation of 2.16 grams:

% Yield = $\frac{2.16 \text{ g}}{2.21 \text{ g}} \times 100 = 97.7$ % Error = $\frac{(2.16 \text{ g} - 2.21 \text{ g})}{2.21 \text{ g}} \times 100 = -2.26$
